Instruction Manual
for Portable Compressor

XAS136 DdG
Warranty and Liability Limitation

Use only authorized parts. Any damage or malfunction caused by the use of unauthorized parts is not covered by Warranty or Product Liability. The manufacturer does not accept any liability for any damage arising from modifications, additions or conversions made without the manufacturer's approval in writing.

Copyright 2004, Atlas Copco Airpower n.v., Antwerp, Belgium. Any unauthorized use or copying of the contents or any part thereof is prohibited. This applies in particular to trademarks, model denominations, part numbers and drawings.
Please read the following instructions carefully before starting to use your machine. Follow the instructions in this booklet and we guarantee you years of troublefree operation.

Always keep the manual available near the machine.

In all correspondence always mention the compressor type and serial number, shown on the data plate.

The company reserves the right to make changes without prior notice.

---

**CALIFORNIA Proposition 65 Warning**

Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects, and other reproductive harm.

1. SAFETY PRECAUTIONS FOR PORTABLE COMPRESSORS WITH GENERATOR

   To be read attentively and acted accordingly before towing, lifting, operating, performing maintenance or repairing the unit

1.1 INTRODUCTION

The policy of Atlas Copco is to provide the users of their equipment with safe, reliable and efficient products. Factors taken into account are among others:
- the intended and predictable future use of the products, and the environments in which they are expected to operate,
- applicable rules, codes and regulations,
- the expected useful product life, assuming proper service and maintenance,
- providing the manual with up-to-date information.

Before handling any product, take time to read the relevant instruction manual. Besides giving detailed operating instructions, it also gives specific information about safety, preventive maintenance, etc.

Keep the manual always at the unit location, easy accessible to the operating personnel.

See also the safety precautions of the engine and possible other equipment, which are separately sent along or are mentioned on the equipment or parts of the unit.

These safety precautions are general and some statements will therefore not always apply to a particular unit.

Only people that have the right skills should be allowed to operate, adjust, perform maintenance or repair on Atlas Copco equipment. It is the responsibility of management to appoint operators with the appropriate training and skill for each category of job.

Skill level 1: Operator
An operator is trained in all aspects of operating the unit with the push-buttons, and is trained to know the safety aspects.

Skill level 2: Mechanical technician
A mechanical technician is trained to operate the unit the same as the operator. In addition, the mechanical technician is also trained to perform maintenance and repair, as described in the instruction manual, and is allowed to change settings of the control and safety system. A mechanical technician does not work on live electrical components.

Skill level 3: Electrical technician
An electrical technician is trained and has the same qualifications as both the operator and the mechanical technician. In addition, the electrical technician may carry out electrical repairs within the various enclosures of the unit. This includes work on live electrical components.

Skill level 4: Specialist from the manufacturer
This is a skilled specialist sent by the manufacturer or its agent to perform complex repairs or modifications to the equipment.

In general it is recommended that not more than two people operate the unit, more operators could lead to unsafe operating conditions. Take necessary steps to keep unauthorized persons away from the unit and eliminate all possible sources of danger at the unit.

When handling, operating, overhauling and/or performing maintenance or repair on Atlas Copco equipment, the mechanics are expected to use safe engineering practices and to observe all relevant local safety requirements and ordinances. The following list is a reminder of special safety directives and precautions mainly applicable to Atlas Copco equipment.

These safety precautions apply to machinery processing or consuming air. Processing of any other gas requires additional safety precautions typical to the application and are not included herein.

Neglecting the safety precautions may endanger people as well as environment and machinery:
- endanger people due to electrical, mechanical or chemical influences,
- endanger the environment due to leakage of oil, solvents or other substances,
- endanger the machinery due to function failures.

All responsibility for any damage or injury resulting from neglecting these precautions or by non-observance of ordinary caution and due care required in handling, operating, maintenance or repair, also if not expressly mentioned in this instruction manual, is disclaimed by Atlas Copco.

The manufacturer does not accept any liability for any damage arising from the use of non-original parts and for modifications, additions or conversions made without the manufacturer’s approval in writing.

If any statement in this manual does not comply with local legislation, the stricter of the two shall be applied.

Statements in these safety precautions should not be interpreted as suggestions, recommendations or inducements that it should be used in violation of any applicable laws or regulations.

1.2 GENERAL SAFETY PRECAUTIONS

1 The owner is responsible for maintaining the unit in a safe operating condition. Unit parts and accessories must be replaced if missing or unsuitable for safe operation.

2 The supervisor, or the responsible person, shall at all times make sure that all instructions regarding machinery and equipment operation and maintenance are strictly followed and that the machines with all accessories and safety devices, as well as the using devices, are in good repair, free of abnormal wear or abuse, and are not tampered with.

3 Whenever there is an indication or any suspicion that an internal part of a machine is overheated, the machine shall be stopped but no inspection covers shall be opened before sufficient cooling time has elapsed; this to avoid the risk of spontaneous ignition of oil vapour when air is admitted.

4 Normal ratings (pressures, temperatures, speeds, etc.) shall be durably marked.

5 Operate the unit only for the intended purpose and within its rated limits (pressure, temperature, speeds, etc.).

6 The machinery and equipment shall be kept clean, i.e. as free as possible from oil, dust or other deposits.

7 To prevent an increase in working temperature, inspect and clean heat transfer surfaces (cooler fins, intercoolers, water jackets, etc.) regularly. See the maintenance schedule.

8 All regulating and safety devices shall be maintained with due care to ensure that they function properly. They may not be put out of action.

9 Care shall be taken to avoid damage to safety valves and other pressure-relief devices, especially to avoid plugging by paint, oil coke or dirt accumulation, which could interfere with the functioning of the device.

10 Pressure and temperature gauges shall be checked regularly with regard to their accuracy. They shall be replaced whenever outside acceptable tolerances.

11 Safety devices shall be tested as described in the maintenance schedule of the instruction manual to determine that they are in good operating condition.

12 Mind the markings and information labels on the unit.

13 In the event the safety labels are damaged or destroyed, they must be replaced to ensure operator safety.

14 Keep the work area neat. Lack of order will increase the risk of accidents.

15 When working on the unit, wear safety clothing. Depending on the kind of activities these are: safety glasses, ear protection, safety helmet (including visor), safety gloves, protective clothing, safety shoes. Do not wear the hair long and loose (protect long hair with a hairnet), or wear loose clothing or jewelry.

16 Take precautions against fire. Handle fuel, oil and anti-freeze with care because they are inflammable substances. Do not smoke or approach with naked flame when handling such substances. Keep a fire-extinguisher in the vicinity.
1.3 SAFETY DURING TRANSPORT AND INSTALLATION

To lift a unit, all loose or pivoting parts, e.g. doors and towbar, shall first be securely fastened.

Do not attach cables, chains or ropes directly to the lifting eye; apply a crane hook or lifting shackle meeting local safety regulations. Never allow sharp bends in lifting cables, chains or ropes.

Helicopter lifting is not allowed.

It is strictly forbidden to dwell or stay in the risk zone under a lifted load. Never lift the unit over people or residential areas. Lifting acceleration and retardation shall be kept within safe limits.

1. Before towing the unit:
   - ascertain that the pressure vessel(s) is (are) depressurized,
   - check the towbar, the brake system and the towing eye. Also check the coupling of the towing vehicle,
   - check the towing and brake capability of the towing vehicle,
   - check that the towbar, jockey wheel or stand leg is safely locked in the raised position,
   - ascertain that the towing eye can swivel freely on the hook,
   - check that the wheels are secure and that the tyres are in good condition and inflated correctly,
   - connect the signalization cable, check all lights and connect the pneumatic brake couplers,
   - attach the safety break-away cable or safety chain to the towing vehicle,
   - remove wheel chocks, if applied, and disengage the parking brake.

2. To tow a unit use a towing vehicle of ample capacity. Refer to the documentation of the towing vehicle.

3. If the unit is to be backed up by the towing vehicle, disengage the overrun brake mechanism (if it is not an automatic mechanism).

4. Never exceed the maximum towing speed of the unit (mind the local regulations).

5. Place the unit on level ground and apply the parking brake before disconnecting the unit from the towing vehicle. Unclip the safety break-away cable or safety chain. If the unit has no parking brake or jockey wheel, immobilize the unit by placing chocks in front of and/or behind the wheels. When the towbar can be positioned vertically, the locking device must be applied and kept in good order.

6. To lift heavy parts, a hoist of ample capacity, tested and approved according to local safety regulations, shall be used.

7. Lifting hooks, eyes, shackles, etc., shall never be bent and shall only have stress in line with their design load axis. The capacity of a lifting device diminishes when the lifting force is applied at an angle to its load axis.

8. For maximum safety and efficiency of the lifting apparatus all lifting members shall be applied as near to perpendicular as possible. If required, a lifting beam shall be applied between hoist and load.

10. A hoist has to be installed in such a way that the object will be lifted perpendicular. If that is not possible, the necessary precautions must be taken to prevent load-swinging, e.g. by using two hoists, each at approximately the same angle not exceeding 30° from the vertical.

11. Locate the unit away from walls. Take all precautions to ensure that hot air exhausted from the engine and driven machine cooling systems cannot be recirculated. If such hot air is taken in by the engine or driven machine cooling fan, this may cause overheating of the unit; if taken in for combustion, the engine power will be reduced.

12. The electrical connections shall correspond to local codes. The machines shall be earthed and protected against short circuits by fuses or circuit breakers.

13. Never connect the generator outlets to an installation which is also connected to a public mains.

14. Before connecting a load, switch off the corresponding circuit breaker, and check whether frequency, voltage, current and power factor comply with the ratings of the generator.

1.4 SAFETY DURING USE AND OPERATION

1. When the unit has to operate in a fire-hazardous environment, each engine exhaust has to be provided with a spark arrester to trap incendiary sparks.

2. The exhaust contains carbon monoxide which is a lethal gas. When the unit is used in a confined space, conduct the engine exhaust to the outside atmosphere by a pipe of sufficient diameter; do this in such a way that no extra back pressure is created for the engine. If necessary, install an extractor. Observe any existing local regulations. Make sure that the unit has sufficient air intake for operation. If necessary, install extra air intake ducts.

3. When operating in a dust-laden atmosphere, place the unit so that dust is not carried towards it by the wind. Operation in clean surroundings considerably extends the intervals for cleaning the air intake filters and the cores of the coolers.

4. Close the compressor air outlet valve before connecting or disconnecting a hose. Ascertain that a hose is fully depressurized before disconnecting it. Before blowing compressed air through a hose or air line, ensure that the open end is held securely, so that it cannot whip and cause injury.

5. The air line end connected to the outlet valve must be safeguarded with a safety cable, attached next to the valve.

6. No external force may be exerted on the air outlet valves, e.g. by pulling on hoses or by installing auxiliary equipment directly to a valve, e.g. a water separator, a lubricator, etc. Do not step on the air outlet valves.

7. Never move a unit when external lines or hoses are connected to the outlet valves, to avoid damage to valves, manifold and hoses.

8. Do not use compressed air from any type of compressor, without taking extra measures, for breathing purposes as this may result in injury or death. For breathing air quality, the compressed air must be adequately purified according to local legislation and standards. Breathing air must always be supplied at stable, suitable pressure.

9. Distribution pipework and air hoses must be of correct diameter and suitable for the working pressure. Never use frayed, damaged or deteriorated hoses. Replace hoses and flexible before the lifetime expires. Use only the correct type and size of hose end fittings and connections.

10. If the compressor is to be used for sand-blasting or will be connected to a common compressed-air system, fit an appropriate non-return valve (check valve) between compressor outlet and the connected sand-blasting or compressed-air system. Observe the right mounting position/direction.

11. Before removing the oil filler plug, ensure that the pressure is released by opening an air outlet valve.

12. Never remove a filler cap of the cooling water system of a hot engine. Wait until the engine has sufficiently cooled down.

13. Never refill fuel while the unit is running, unless otherwise stated in the Atlas Copco Instruction Book. Keep fuel away from hot parts such as air outlet pipes or the engine exhaust. Do not smoke when fuelling. When fuelling from an automatic pump, an earthing cable should be connected to the unit to discharge static electricity. Never spill nor leave oil, fuel, coolant or cleansing agent in or around the unit.
14 All doors shall be shut during operation so as not to disturb the cooling air flow inside the bodywork and/or render the silencing less effective. A door should be kept open for a short period only e.g. for inspection or adjustment.

15 Periodically carry out maintenance works according to the maintenance schedule.

16 Stationary housing guards are provided on all rotating or reciprocating parts not otherwise protected and which may be hazardous to personnel. Machinery shall never be put into operation, when such guards have been removed, before the guards are securely reinstalled.

17 Noise, even at reasonable levels, can cause irritation and disturbance which, over a long period of time, may cause severe injuries to the nervous system of human beings. When the sound pressure level, at any point where personnel normally has to attend, is:
   - below 70 dB(A): no action needs to be taken,
   - above 70 dB(A): noise-protective devices should be provided for people continuously being present in the room,
   - below 85 dB(A): no action needs to be taken for occasional visitors staying a limited time only,
   - above 85 dB(A): room to be classified as a noise-hazardous area and an obvious warning shall be placed permanently at each entrance to alert people entering the room, for even relatively short times, about the need to wear ear protectors,
   - above 95 dB(A): the warning(s) at the entrance(s) shall be completed with the recommendation that also occasional visitors shall wear ear protectors,
   - above 105 dB(A): special ear protectors that are adequate for this noise level and the specific composition of the noise shall be provided and a special warning to that effect shall be placed at each entrance.

18 Insulation or safety guards of parts the temperature of which can be in excess of 80 °C (175 °F) and which may be accidentally touched by personnel shall not be removed before the parts have cooled to room temperature.

19 Never operate the unit in surroundings where there is a possibility of taking in flammable or toxic fumes.

20 If the working process produces fumes, dust or vibration hazards, etc., take the necessary steps to eliminate the risk of personnel injury.

21 When using compressed air or inert gas to clean down equipment, do so with caution and use the appropriate protection, at least safety glasses, respiratory organs must be protected and depending on the nature of the hazard, so must the eyes and skin.

22 When washing parts in or with a cleaning solvent, provide the required ventilation and use appropriate protection such as a breathing filter, safety glasses, rubber apron and gloves, etc.

23 Safety shoes should be compulsory in any workshop and if there is a risk, however small, of falling objects, wearing of a safety helmet should be included.

24 If there is a risk of inhaling hazardous gases, fumes or dust, the respiratory organs must be protected and depending on the nature of the hazard, so must the eyes and skin.

25 Remember that where there is visible dust, the finer, invisible particles will almost certainly be present too; but the fact that no dust can be seen is not a reliable indication that dangerous, invisible dust is not present in the air.

26 Never operate the unit at pressures or speeds below or in excess of its limits as indicated in the technical specifications.

27 Never operate the generator in excess of its limits as indicated in the technical specifications and avoid long no-load sequences.

28 Never operate the generator in a humid atmosphere. Excessive moisture causes worsening of the generator insulation.

29 Do not open electrical cabinets, cubicles or other equipment while voltage is supplied. If such cannot be avoided, e.g. for measurements, tests or adjustments, have the action carried out by a qualified electrician only, with appropriate tools, and ascertain that the required bodily protection against electrical hazards is applied.

30 Never touch the power terminals during operation of the machine.

31 Whenever an abnormal condition arises, e.g. excessive vibration, noise, odour, etc., switch the circuit breakers to OFF and stop the engine. Correct the faulty condition before restarting.

32 Check the electric cables regularly. Damaged cables and insufficient tightening of connections may cause electric shocks. Whenever damaged wires or dangerous conditions are observed, switch the circuit breakers to OFF and stop the engine. Replace the damaged wires or correct the dangerous condition before restarting. Make sure that all electric connections are securely tightened.

33 Avoid overloading the generator. The generator is provided with circuit breakers for overload protection. When a breaker has tripped, reduce the concerned load before restarting.

34 If the generator is used as stand-by for the mains supply, it must not be operated without control system which automatically disconnects the generator from the mains when the mains supply is restored.

35 Never remove the cover of the output terminals during operation. Before connecting or disconnecting wires, switch off the load and the circuit breakers, stop the machine and make sure that the machine cannot be started inadvertently or there is any residual voltage on the power circuit.

36 Running the generator at low load for long periods will reduce the lifetime of the engine.

1.5 SAFETY DURING MAINTENANCE AND REPAIR

Maintenance, overhaul and repair work shall only be carried out by adequately trained personnel; if required, under supervision of someone qualified for the job.

1 Use only the correct tools for maintenance and repair work, and only tools which are in good condition.

2 Parts shall only be replaced by genuine Atlas Copco replacement parts.

3 All maintenance work, other than routine attention, shall only be undertaken when the unit is stopped. Steps shall be taken to prevent inadvertent starting. In addition, a warning sign bearing a legend such as "work in progress; do not start" shall be attached to the starting equipment.

On engine-driven units the battery shall be disconnected and removed or the terminals covered by insulating caps.

On electrically driven units the main switch shall be locked in open position and the fuses shall be taken out. A warning sign bearing a legend such as "work in progress; do not supply voltage" shall be attached to the fuse box or main switch.

4 Before dismantling any pressurized component, the compressor or equipment shall be effectively isolated from all sources of pressure and the entire system shall be relieved of pressure. Do not rely on non-return valves (check valves) to isolate pressure systems. In addition, a warning sign bearing a legend such as "work in progress; do not open" shall be attached to each of the outlet valves.

5 Prior to stripping an engine or other machine or undertaking major overhaul on it, prevent all movable parts from rolling over or moving.

6 Make sure that no tools, loose parts or rags are left in or on the machine.

7 Never leave rags or loose clothing near the engine air intake.

8 Never use flammable solvents for cleaning (fire-risk).

9 Take safety precautions against toxic vapours of cleaning liquids.

10 Never use machine parts as a climbing aid.

11 Observe scrupulous cleanliness during maintenance and repair. Keep away dirt, cover the parts and exposed openings with a clean cloth, paper or tape.
Always make sure that oil, solvents, and other substances that are likely to pollute the environment are disposed of in an environmentally friendly manner. Do not remove any of, or tamper with, the sound-damping material. Keep the material free of dirt and liquids such as fuel, oil, and cleansing agents. If any sound-damping material is damaged, replace it to prevent damage to the sound pressure level from increasing.

When performing any operation involving heat, flames or sparks on a machine, the surrounding components shall first be screened with non-flammable material. Protect the engine, alternator, air intake filter, electrical and regulating components, etc., to prevent moisture ingress, e.g. when steam-cleaning.

In any way modify, pressure vessels. Disconnect the alternator cables when starting up the machine initially and after any alteration to the machine or driver. Check the direction of rotation of electric motors rotary ones to ensure that there is no mechanical interference within the machine or driver. Check the direction of rotation of electric motors when starting up the machine initially and after any alteration to the electrical connection(s) or switch gear, to check that the oil pump and the fan function properly.

Apply the proper tool for each job. With the knowledge of correct tool use and the limitations of tools, along with some common sense, many accidents can be prevented.

Special service tools are available for specific jobs and should be used when recommended. The use of these tools will save time and prevent damage to parts.

1.7 SPECIFIC SAFETY PRECAUTIONS

Batteries

When servicing batteries, always wear protecting clothing and glasses.

The electrolyte in batteries is a sulphuric acid solution which is fatal if it hits your eyes, and which can cause burns if it contacts your skin. Therefore, be careful when handling batteries, e.g. when checking the charge condition.

Install a sign prohibiting fire, open flame and smoking at the post where batteries are being charged.

When batteries are being charged, an explosive gas mixture forms in the cells and might escape through the vent holes in the plugs. Thus an explosive atmosphere may form around the battery if ventilation is poor, and can remain in and around the battery for several hours after it has been charged. Therefore:

- never smoke near batteries being, or having recently been, charged;
- never break live circuits at battery terminals, because a spark usually occurs.

When connecting an auxiliary battery (AB) in parallel to the unit battery (CB) with booster cables: connect the + pole of AB to the + pole of CB, then connect the - pole of CB to the mass of the unit. Disconnect in the reverse order.

Pressure vessels

(according to directive 87/404/EEC annex II § 2)

Maintenance/installation requirements:

- medium AIR/OIL,
- pressure vessel for compressor,
- pressure vessel for separator, and operates as detailed on the data plate of the vessel:
  - the maximum working pressure ps in bar (psi),
  - the maximum working temperature T_max in °C (°F),
  - the minimum working temperature T_min in °C (°F),
  - the capacity of the vessel V in l (US gal, Imp gal, cu.ft).

The pressure vessel is only to be used for the applications as specified above and in accordance with the technical specifications. Safety reasons prohibit any other applications.

National legislation requirements with respect to re-inspection must be complied with. No welding or heat treatment of any kind is permitted to those vessel walls which are exposed to pressure.

The vessel is provided and may only be used with the required safety equipment such as manometer, overpressure control devices, safety valve, etc.

Draining of condensate shall be performed regularly when vessel is in use.

Installation, design and connections should not be changed.

Bolts of cover and flanges may not be used for extra fixation.

Safety valves

All adjustments or repairs are to be done by an authorized representative of the valve supplier (see maintenance schedule 4.2).
2. LEADING PARTICULARS

2.1 DESCRIPTION OF SAFETY PICTOGRAMS USED IN THIS MANUAL

This symbol draws your attention to dangerous situations. The operation concerned may endanger persons and cause injuries.

This symbol is followed by supplementary information.

![Fig. 2.1 General view of XAS136 DdG with some options](image)

2.2 GENERAL DESCRIPTION

The XAS136 DdG is a silenced, single-stage, oil-injected screw compressor, built for a nominal effective working pressure of 7 bar.

- **Engine**
  The compressor is driven by an oil-cooled diesel engine.
  The engine’s power is transmitted to the compressor through a heavy-duty coupling.

- **Compressor**
  The compressor casing houses two screw-type rotors, mounted on ball and roller bearings. The male rotor, driven by the engine, drives the female rotor. The element delivers pulsation-free air.
  Injected oil is used for sealing, cooling and lubricating purposes.

- **Compressor oil system**
  The oil is boosted by air pressure. The system has no oil pump.
  The oil is removed from the air, in the air/oil vessel at first by centrifugal force, secondly by the oil separator element.
  The vessel is provided with an oil level indicator.

- **Regulation**
  The compressor is provided with a continuous regulating system and a blow-down valve which is integrated in the unloader assembly. The valve is closed during operation by air receiver pressure and opens by air receiver pressure via the compressor element when the compressor is stopped.
  When the air consumption increases, the air receiver pressure will decrease and vice versa.
  This receiver pressure variation is sensed by the regulating valve which, by means of control air to the unloader and engine speed regulator, matches the air output to the air consumption. The air receiver pressure is maintained between the pre-selected working pressure and the corresponding unloading pressure.

- **Cooling system**
  The engine and compressor are provided with oil coolers.
  The cooling air is generated by a fan, driven by the engine.

- **Safety devices**
  A thermal shut-down switch protects the compressor against overheating. The air receiver is provided with a safety valve.
  The engine is equipped with low oil pressure and high oil temperature shut-down switches.

- **Frame and axle**
  The compressor/engine unit is supported by rubber buffers in the frame.
  The standard unit has a non-adjustable towbar with a towing eye.
  As an option the unit can be equipped with an adjustable towbar, an overrun and parking brake and towing eyes type DIN, ball, ITA, GB, NATO, AC (France), (for available options see chapter 7).
  The braking system consists of an integrated parking brake and overrunbrake. When driving backwards the overrunbrake is not engaged automatically.

- **Bodywork**
  The bodywork has openings at the shaped front and rear end for the intake and outlet of cooling air and hinged doors for maintenance and service operations. The bodywork is internally lined with sound-absorbing material.

- **Lifting eye**
  A lifting eye is accessible when the small door at the top of the unit is unlocked.

- **Control panel**
  The control panel grouping the air pressure gauge, control switch etc., is placed at the right hand/ rear end corner.

- **Data plate**
  The compressor is furnished with a data plate showing the product code, the unit number and the working pressure (see chapter 9).

- **Serial number**
  The serial number is located on the right-hand side towards the front on the upper edge of the frame and also on the data plate.

- **Generator**
  The built-in generator is driven by a multi V-belt drive. The generated current can be drawn via 3 sockets (3 x 16 A, 2 x 3 phases, 1 x 1 phase).
  The compressor and the generator of the XAS136 DdG may be used simultaneously.

### COMPRESSOR REGULATING SYSTEM (LOAD CONDITION)

The system comprises:

- **AF**: Air filter
- **AR/OS**: Air receiver/oil separator
- **CE**: Compressor element
- **UA/UV**: Unloader assembly with unloader valve
- **BDV**: Blow-down valve
- **LV**: Loading valve

Air drawn through the airfilter (AF<sub>CE</sub>) into the compressor element (CE) is compressed. At the element outlet, compressed air and oil pass into the air receiver/oil separator (AR/OS).

The check valve (CV) prevents blow-back of compressed air when the compressor is stopped. In the air receiver/oil separator (AR/OS), most of the oil is removed from the air/oil mixture; the remaining oil is removed by the separator element.

The oil collects in the receiver and on the bottom of the separator element.

The air leaves the receiver via a minimum pressure valve (MPV) which prevents the receiver pressure from dropping below the minimum working pressure (specified in section 8.3), even when the air outlet valves are open. This ensures adequate oil injection and prevents oil consumption.

A temperature switch (TS) and a working pressure gauge (PG) are comprised in the system.

A blow-down valve (BDV) is fitted in the unloader assembly to automatically depressurise the air receiver (AR) when the compressor is stopped.
2.6 **OIL SYSTEM**  
(SEE Fig. 2.3)

The system comprises:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AR/OS</td>
<td>Air receiver/oil separator</td>
</tr>
<tr>
<td>OC&lt;sub&gt;CE&lt;/sub&gt;</td>
<td>Oil cooler</td>
</tr>
<tr>
<td>OF</td>
<td>Oil filter</td>
</tr>
</tbody>
</table>

The lower part of the air receiver (AR) serves as oil tank.

Air pressure forces the oil from the air receiver/oil separator (AR/OS) through the oil cooler (OC<sub>CE</sub>) and oil filter (OF) to the compressor element (CE).

The compressor element has an oil gallery in the bottom of its casing. The oil for rotor lubrication, cooling and sealing is injected through holes in the gallery.

Lubrication of the bearings is ensured by oil injected into the bearing housings.

The injected oil, mixed with the compressed air, leaves the compressor element and re-enters the air receiver, where it is separated from the air as described in section 2.5. The oil that collects in the bottom of the oil separator element is returned to the system through scavenging line (SL), which is provided with a flow restrictor (FR).

The oil filter by-pass valve opens when the pressure drop over the filter is above normal because of a clogged filter. The oil then by-passes the filter without being filtered. For this reason, the oil filter must be replaced at regular intervals (see section 4.2).

2.7 **CONTINUOUS REGULATING SYSTEM**  
(SEE Fig. 2.3)

The system comprises:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RV</td>
<td>Regulating valve</td>
</tr>
<tr>
<td>UA</td>
<td>Unloader assembly</td>
</tr>
<tr>
<td>SR</td>
<td>Speed regulator</td>
</tr>
</tbody>
</table>

The compressor is provided with a continuous regulating system. This system is provided with a blow-down valve which is integrated in the unloader assembly (UA). The valve is closed during operation by air receiver pressure and opens by air receiver pressure via the compressor element when the compressor is stopped.

When the air consumption increases, the air receiver pressure will decrease and vice versa. This receiver pressure variation is sensed by the regulating valve which, by means of control air to the unloader, matches the air output to the air consumption. The air receiver pressure is maintained between the pre-selected working pressure and the corresponding unloading pressure.

When starting the compressor, the unloader valve (UV) is kept open by spring force, the engine runs at maximum speed. The compressor element (CE) takes in air and pressure builds up in the receiver (AR).

The air output is controlled from maximum output (100%) to no output (0%) by:

1. Speed control of the engine between maximum load speed and unloading speed (the output of a screw compressor is proportional to the rotating speed).
2. Air inlet throttling.

If the air consumption is equal to or exceeds the maximum air output, the engine speed is held at maximum load speed and the unloading valve is fully open.

If the air consumption is less than the maximum air output, the regulating valve supplies control air to unloader valve (UV) to reduce the air output and holds air receiver pressure between the normal working pressure and the corresponding unloading pressure of approx. 1.5 bar above the normal working pressure.

When the air consumption is resumed, the blow off valve (BOV) closes and the unloader valve (UV) gradually opens the air intake and the speed regulator (SR) increases the engine speed.

The construction of the regulating valve (RV) is such that any increase (decrease) of the air receiver pressure above the pre-set valve opening pressure results in a proportional increase (decrease) of the control pressure to the unloading valve and the speed regulator.

Part of the control air is vented to atmosphere, and any condensate discharged, through the vent holes (VH).

XAS136 DdG:  
When the generator is switched on, the solenoid valve (SVA) via the speed regulator (SR) controls the motor and allows it to reach maximum speed (the normal control system is switched off).
2.8 ELECTRICAL SYSTEM

2.8.1 CIRCUIT DIAGRAM

The compressor is equipped with a negative earthed system.

XAS136 DdG:
This generator is built to supply a sheer alternating current IT network.

Note:
1 To be used with Cold Start Option.
2 To be used with Refinery Equipment.
3 Position of DIP-switches

Fig. 2.4 Circuit diagram (Nr. 9822 0893 11 + Nr. 9822 0893 40)
2.8.2 DESCRIPTION

(SEE FIG. 2.4)

Only use the generator after the compressor has been switched over from NO-LOAD to LOAD.

Generator function:

Turn switch S6 to position 1. The solenoid valve Y2G via the speed regulator SR controls the motor and allows it to reach maximum speed (the normal control system is switched off). Lamp H1 is activated (sockets X1.1, X1.2, X1.3 are under tension).

The generator can be switched off by turning switch S6 to position 0.

In the case of an insulation fault, lamp H2 of the system is activated. When the red lamp H2 is active, a reset can only be made by stopping and restarting the unit.

3. OPERATING INSTRUCTIONS

3.1 Parking, Towing and Lifting Instructions

Safety precautions.

The operator is expected to apply all relevant safety precautions, including those mentioned on the pages 5 - 8 of this book.

Attention:
- Before putting the compressor in to use, check the brake system as described in section 5.6.
- After the first 100 km travel:
  - Check and retighten the wheel nuts and towbar bolts to the specified torque. See section 3.1.3 and section 8.1.
  - Check the brake adjustment. See section 5.6.

3.1.1 Parking Instructions

Fig. 3.1 Non-adjustable towbar with standard support leg without brakes

When parking a compressor, secure support leg (1) or jockey wheel (2) to support the compressor in a level position. Be sure that the jockey wheel (2) is blocked by the blocking pin (6).

Apply parking brake by pulling parking brake handle (3) upwards. Place the compressor as level as possible; however, it can be operated temporarily in an out-of-level position not exceeding 15°. If the compressor is parked on sloping ground, immobilize the compressor by placing wheel chocks (available as option) in front of or behind the wheels. Locate the rear-end of the compressor upwind, (see Fig. 3.4), away from contaminated wind-streams and walls. Avoid recirculation of exhaust air from the engine. This causes overheating and engine power decrease.

3.1.2 Towing Instructions

Fig. 3.2 Adjustable towbar with jockey wheel and brakes

Before towing the compressor, ensure that the towing equipment of the vehicle matches the towing eye or ball connector and ensure that the service doors are closed and locked properly.

Push the hand brake lever (3) completely downwards and connect breakaway cable (5) to the vehicle. Secure jockey wheel (2) or support leg (1) in the highest possible position. The jockey wheel is prevented from turning.

Fig. 3.3 Parking position of jockey wheel

Fig. 3.4 Rear-end of compressor upwind

Fig. 3.5 Label on towbar, towing instructions

Fig. 3.6 Towing position of jockey wheel
3.1.3 **HEIGHT ADJUSTMENT (WITH ADJUSTABLE TOWBAR)**

Before towing the compressor, make sure that the joints of the towbar are secured with maximum strength without damaging the towbar. Be sure that there is no clearance between the teeth of the joints.

For specific instruction see below!

![Fig. 3.7](image)

Table 1

</tbody>
</table>

Fig. 3.8

- Remove spring pin (1).
- Release locking nut (2) with support tools (Extension tube 3).
- Adjust required height of the towbar.
- Tighten locking nut (2) by hand first.
- Secondly tighten locking nut (2) with a tightening torque corresponding to table 1 (Fig. 3.8). With an extension tube (3) "A" corresponding to table 1 and handforce "B" corresponding to table 1 easy tightening is possible.
- Fix locking nut (2) with spring pin (1).

**Attention:**

- Height adjustment should be undertaken on levelled ground and in coupled condition.
- When readjusting, make sure that the front point of the towbar is horizontal to the coupling point.
- Before starting a trip, ensure that the adjustment shaft is secure, so that the stability and safety is guaranteed while driving. If necessary tighten the locking nut (2) corresponding to table 1 (Fig. 3.8).

3.1.4 **LIFTING INSTRUCTIONS**

![Fig. 3.9](image)

When lifting the compressor, the hoist has to be placed in such a way that the compressor, which must be placed level, will be lifted vertically. Keep lifting acceleration and retardation within safe limits.

- Preferably use the lifting eye (1) herefore open the small door (2).

**Lifting acceleration and retardation must be kept within safe limits (max. 2g).**

**Helicopter lifting is not allowed.**

**Lifting is not allowed when the unit is running.**

3.2 **BEFORE STARTING**

1. Before initial start-up, prepare battery for operation if not already done. See section 4.7.
2. With the compressor standing level, check the level of the engine oil. Add oil, if necessary, to the upper mark on dipstick. Consult the Engine Operation Manual for the type and viscosity grade of the engine oil.
3. Check the level of the compressor oil. The pointer of oil level gauge (Fig. 2.3, OLG) should register in the green range. Add oil if necessary. See section 4.3 for the oil to be used.
4. Check that the fuel tank contains sufficient fuel. Top up, if necessary. Consult the Engine Operation Manual for the type of fuel.
5. Drain any water and sediment from the fuel filter until clean fuel flows from the drain cock.
6. Press vacuator valves (Fig. 2.3, VV) of the air filters to remove dust.
7. Check the air filter vacuum indicators (Fig. 2.3, VI). If the yellow piston reaches the red marked service range, replace the filter element. Reset the indicator by pushing the reset button.
8. Open air outlet valve to allow air flow to the atmosphere.
3.3 STARTING/STOPPING

3.3.1 GENERAL

Make sure the fuel tank is filled up.

Before starting, first operate the circuit breaker button (F1) at the right side of the control panel (open right-hand service door first).

To start, the start/stop button (S) is switched to position "I", the green fuel ON lamp (H1), the red charge indication lamp (H3) and preheat lamp (H2) go on (preheat lamp only, if "cold start" option is installed). After preheating, the preheat lamp goes out. Push the start/stop button in position "0", 20 sec. cranking, 1 min. rest (= a cycle). Max. 3 cycles are allowed. The starter motor will set the engine in motion. Lamps H1 and H3 will go out as soon as the engine has been started.

Run the engine a few minutes at no-load to warm up.

When the engine is running smoothly, press loading valve (LV) and release as soon as pressure starts to build up.

Shutting down is simply done by pushing the start button in the "0" position.

The control panel in addition indicates receiver pressure (PG) and accumulated operating hours (P1).

Fault situations and protective devices (Also refer to chapter 6 Problem Solving):

- The starter motor is protected against prolonged starting or against attempts to start when the unit is already running. (max. cranking time: 20 sec.)
- A fault which occurs with the engine, either alternator voltage (too low), oil pressure too low or fuel level too low will always and immediately cause the engine to cut out and one of the control lamps H3, H5, H6 or H7 to light up.
- When the outlet temperature of the element becomes too high, a thermocontact will also switch off the unit immediately. Control lamp H4 will light up.
- The control lamps will remain on until the unit has been reset (start button switched to position "0").
3.3.2 Generator Function (XAS136 DdG)

![Control panel (generator)](image)

- H9 Lamp (red)  X1.2 Socket 400 V/16 A
- X1.1 Socket 400 V/16 A  X1.3 Socket 230 V/16 A

Start the unit in accordance with the normal procedure. Let the motor warm up until it reaches operational temperature.

Only use the generator after the compressor has been switched over from NO-LOAD to LOAD.

![Generator control box](image)

- Q1 Main circuit breaker 4-pole
- K8 Insulation monitoring relay

Before connecting an electrical device, always check the data listed on the rating plate.

Fault situations and protective devices:
- Open the left machine door and check that the circuit breakers are up. If the circuit breakers are down, put them up (switch them on). Circuit breakers in the up position can be indicative of a serious electrical fault.
- When the red lamp H9 is activated, it means that a serious insulation fault has occurred. Reset by first switching off the motor, then restart it.
- The insulation monitoring relay K8 must be adjusted to 10 kΩ. This adjustment may not be changed.

3.4 During Operation

The doors must be closed during operation and may be opened for short periods only.

Regularly carry out following checks:

1. That regulating valve (Fig. 2.2, RV) is correctly adjusted, i.e. starts decreasing the engine speed when reaching the preset working pressure in the receiver.
2. Check the air filter vacuum indicators (Fig. 2.2, VI). If the yellow piston reaches the red marked service range, replace the filter element. Reset the indicators by pushing the reset button.
4. MAINTENANCE

4.1 USE OF SERVICE PAKS

Service Paks include all genuine parts needed for normal maintenance of both compressor and engine.

Service Paks minimize downtime and keep your maintenance budget low.

Order Service Paks at your local Atlas Copco dealer.

</tbody>
</table>

(1) More frequently when operating in a dusty environment.
(2) Replace the element when the pressure drop exceeds 0.8 bar.
(3) Refer to the Deutz operation manual.
(4) 500 hours only valid when using PAROIL SAE 15 W 40.
(5) In case of poor fuel quality, replace fuel filter more frequently.
(6) Clean retainer when replacing element.

Keep the bolts of the housing, the lifting eye, the towbar and the axle securely tightened.
Refer to section 8 'Technical specifications' and section 3.1.3 for the torque values.

4.2 PREVENTIVE MAINTENANCE SCHEDULE FOR THE COMPRESSOR

The schedule contains a summary of the maintenance instructions. Read the respective section before taking maintenance measures.

When servicing, replace all disengaged packings, e.g. gaskets, O-rings, washers.

For engine maintenance refer to Engine Operation Manual.

The maintenance schedule has to be seen as a guideline for units operating in a dusty environment typical to compressor applications. Maintenance schedule can be adapted depending on application environment and quality of maintenance.
4.3 LUBRICATION OILS

High-quality, mineral, hydraulic or synthesized hydrocarbon oil with rust and oxidation inhibitors and anti-foam and anti-wear properties is recommended. The viscosity grade should correspond to the ambient temperature and ISO 3448, as follows:

<table>
<thead>
<tr>
<th>Type of lubricant</th>

- 209 liter barrel: order number 1615 5955 00

Synthetic compressor oil PAROIL S:
- 5 liter can: order number 1615 5950 00
- 20 liter can: order number 1615 5951 00
- 209 liter barrel: order number 1615 5952 00

Never mix synthetic with mineral oil.

Remark:
When changing from mineral to synthetic oil (or the other way around), you will need to do an extra rinse:

After doing the complete change procedure to synthetic oil, run the unit for a few minutes to allow good and complete circulation of the synthetic oil. Then drain the synthetic oil again and fill again with new synthetic oil. To set correct oil levels, proceed as in normal instruction.

4.4 OIL LEVEL CHECK

Never mix oils of different brands or types.

Use only non-toxic oils where there is a risk of inhaling delivered air.

4.4.1 CHECK ENGINE OIL LEVEL

Consult also the Engine Operation Manual for the oil specifications, viscosity recommendations and oil change intervals.

See schedule.

Check engine oil level according to the instructions in the Engine Operation Manual and top up with oil if necessary.

4.4.2 CHECK COMPRESSOR OIL LEVEL

With the unit standing level, check the level of the compressor oil. The pointer of the oil level gauge (1) must register in the upper extremity of the green range. Add oil if necessary.

Before removing oil filler plug (2), ensure that the pressure is released by opening an air outlet valve (3).

4.5 OIL AND OIL FILTER CHANGE

Never mix oils of different brands or types.

Use only non-toxic oils where there is a risk of inhaling delivered air.

4.5.1 ENGINE OIL AND OIL FILTER CHANGE

See section 4.2.
4.5.2 COMPRESSOR OIL AND OIL FILTER CHANGE

The quality and the temperature of the oil determine the oil change interval.

The prescribed interval (see section 4.2) is based on an oil temperature of up to 100 °C and normal operating conditions.

When operating in high ambient temperatures, in very dusty or high humidity conditions, it is recommended to change the oil more frequently.

In this case, contact Atlas Copco.

1. Run the compressor until warm. Close the outlet valve(s) (5) and stop the compressor. Wait until the pressure is released through the automatic blow-down valve. Unscrew the oil filler plug (2) one turn. This uncovers a vent hole, which permits any pressure in the system to escape.

2. Drain the oil by removing all relevant drain plugs. Drain plugs are located at the air receiver, compressor element and compressor oil cooler. Catch the oil in a drain pan. Screw out the filler plug to speed up draining. Tighten the plugs after draining.

3. Remove the oil filter (3), e.g. by means of a special tool. Catch the oil in a drain pan.

4. Clean the filter seat on the manifold, taking care that no dirt drops into the system. Oil the gasket of the new filter element. Screw it into place until the gasket contacts its seat, then tighten one half turn only.

5. Fill the air receiver until the pointer of the oil level gauge (4) registers in the upper extremity of the green range. Take care that no dirt drops into the system. Reinstall and tighten the filler plug.

6. Run the unit at no load for a few minutes to circulate the oil and to evacuate the air trapped in the oil system.

7. Stop the compressor. Let the oil settle for a few minutes. Check that the pressure is released by opening an air outlet valve (5). Screw out filler plug (2) and add oil until the pointer of the oil level gauge (4) again registers in the upper extremity of the green range. Reinstall and tighten the filler plug.

Never add more oil. Overfilling results in oil consumption.

4.6 CLEANING COOLERS

Keep the coolers (1) and (2) clean to maintain the cooling efficiency.

- Remove any dirt from the coolers with a fibre brush. Never use a wire brush or metal objects.
- Steam cleaning in combination with a cleansing agent may be applied.
- To avoid damaging the coolers, angle between jet and coolers should be approx. 90 °.
- (do not use jet at max. power)
- Protect the electrical and controlling equipment, air filters, etc. against penetration of moisture.
- Close the service door(s).

Never leave spilled liquids such as fuel, oil, water and cleansing agents in or around the compressor.
4.7 BATTERY CARE

Before handling batteries, read the relevant safety precautions and act accordingly.

If the battery is still dry, it must be activated as described in section 4.7.2.

The battery must be in operation within 2 months from being activated; if not, it needs to be recharged first.

4.7.1 ELECTROLYTE

Read the safety instructions carefully.

Electrolyte in batteries is a sulphuric acid solution in distilled water. The solution must be made up before being introduced into the battery.

4.7.2 ACTIVATING A DRY-CHARGED BATTERY

- Take out the battery.
- Battery and electrolyte must be at equal temperature above 10°C.
- Remove cover and/or plug from each cell.
- Fill each cell with electrolyte until the level reaches 10 to 15 mm above the plates, or to the level marked on the battery.
- Rock the battery a few times so that possible air bubbles can escape; wait 10 minutes and check the level in each cell once more; if required, add electrolyte.
- Refit plugs and/or cover.
- Place the battery in the compressor.

4.7.3 RECHARGING A BATTERY

Before and after charging a battery, always check the electrolyte level in each cell; if required, top up with distilled water only. When charging batteries, each cell must be open, i.e. plugs and/or cover removed.

Use a commercial automatic battery charger according to its manufacturer’s instructions.

Apply with preference the slow charging method and adjust the charge current according to the following rule of thumb: battery capacity in Ah divided by 20 gives safe charging current in Amp.

4.7.4 BATTERY MAINTENANCE

- Keep the battery clean and dry.
- Keep the electrolyte level at 10 to 15 mm above the plates or at the indicated level; top up with distilled water only.
- Keep the terminals and clamps tight, clean, and lightly covered with petroleum jelly.

4.8 STORAGE

Run the compressor regularly, e.g. twice a week, until warm.

Load and unload the compressor a few times to operate the unloading and regulating components. Close the air outlet valves after stopping.

If the compressor is going to be stored without running from time to time, protective measures must be taken.

4.9 SERVICE PAKS

A Service Pak is a collection of parts to be used for a specific maintenance measure.

It guarantees that all necessary parts are replaced at the same time keeping down time to a minimum.

The order number of the Service Paks are listed in the Atlas Copco Parts List.

4.10 SERVICE KITS

A service kit is a collection of parts to fit a specific repair or rebuilding task.

It guarantees that all necessary parts are replaced at the same time which improves the uptime of the unit.

The order numbers of the Service Kits are listed in the Atlas Copco Parts List.

Contact Atlas Copco.

4.11 COMPRESSOR ELEMENT OVERHAUL

When a compressor element is due for overhaul, it is recommended to have it done by Atlas Copco. This guarantees the use of genuine parts and correct tools with care and precision.

4.12 LIABILITY

The manufacturer does not accept any liability for any damage arising from the use of non-original parts and for modifications, additions or conversions made without the manufacturer’s approval in writing.
5. ADJUSTMENTS AND SERVICING PROCEDURES

5.1 ADJUSTMENT OF THE CONTINUOUS REGULATING SYSTEM

To adjust the normal working pressure, proceed as follows:

1. Start and warm up the engine (see section 3.3).
2. With the outlet valves (AOV) closed, loosen the regulating valve’s lock nut and adjust the regulating valve (RV) until a pressure of X bar(e) is reached (see table).
3. Check the minimum speed of the engine. Adjust minimum speed stop screw if necessary.
4. Open an outlet valve (AOV) just enough to let the engine (E) run at maximum speed. The working pressure must be Y bar(e); adjust if necessary with regulating valve (RV) (see table).

5. Check the engine maximum speed. Adjust the maximum speed by means of adjusting eccentric nut on top of speed regulator (SR).
6. Close the outlet valves (AOV), check that the pressure is between Z1 and Z2 bar(e) (see table). Lock the regulating valve (RV) by fixing the lock nut.

The working pressure is determined by the tension of the spring in the regulating valve (RV). This tension can be increased to raise the pressure and decreased to lower it by turning the adjusting wheel clockwise and anti-clockwise respectively.

Table

<table>
<thead>
<tr>
<th></th>
<th>X bar(e)</th>

Fig. 5.1

The working pressure is determined by the tension of the spring in the regulating valve (RV). This tension can be increased to raise the pressure and decreased to lower it by turning the adjusting wheel clockwise and anti-clockwise respectively.
5.2 AIR FILTER ENGINE/COMPRESSOR

5.2.1 MAIN PARTS

- 1 Snap clips
- 2 Dust trap
- 3 Safety cartridge (option)
- 4 Filter element
- 5 Filter housing
- 6 Vacuator valve

![Diagram of air filter]

5.2.2 RECOMMENDATIONS

The Atlas Copco air filters are specially designed for the application. The use of non-genuine air filters may lead to severe damage of engine and/or compressor element.

Never run the compressor without air filter element.

New elements must also be inspected for tears or punctures before installation.

Discard the element (4) when damaged.

In heavy duty applications it is recommended to install a safety cartridge which can be ordered with part no.: 2914 9311 00

A dirty safety cartridge (3) is an indication of a mal-functioning air filter element. Replace the element and the safety cartridge in this case.

The safety cartridge cannot be cleaned.

5.2.3 CLEANING THE DUST TRAP

To remove dust from the dust trap pinch the vacuator valve (6) several times.

5.2.4 REPLACING THE AIR FILTER ELEMENT

1. Release the snap clips (1) and remove the dust trap (2). Clean the trap.
2. Remove the element (4) from the housing (5).
3. Reassemble in reverse order of dismantling.
4. Inspect and tighten all air intake connections.
5. Reset the vacuum indicator (Fig. 5.3).

![Diagram of vacuum indicator]

5.3 AIR RECEIVER

The air receiver is tested according to official standards. Regularly have inspections carried out in conformity with local regulations.

5.4 SAFETY VALVE

All adjustments or repairs are to be done by an authorized representative of the valve supplier.

Following checks must be carried out:

- a check of the opening of the lifting gear, twice a year.
  This can be done by screwing the cap of the valve anti-clockwise.
- a check of the set pressure once a year according to the local regulations. This check cannot be done on the machine and must be carried out on a proper test bench.
5.5 FUEL SYSTEM

Replacing the filter element

1. Unscrew the filter element (1) from the adapter head.

2. Clean the adapter head sealing surface. Lightly oil the gasket of the new element and screw the latter onto the header until the gasket is properly seated, then tighten with both hands.

3. Check for fuel leaks once the engine has been restarted.

5.6 BRAKE (= OPTION) ADJUSTMENT

Before jacking up the compressor, connect it to a towing vehicle or attach a weight of minimum 50 kg to the towbar.

5.6.1 BRAKE SHOE ADJUSTMENT

Check the thickness of the brake lining. Remove both black plastic plugs (5), one on each wheel. When the brake lining has been worn to a thickness of 1 mm or less, the brake shoes have to be replaced. After inspection and/or replacement re-insert both plugs.

Brake shoe adjustment re-establishes the brake lining-to-drum clearance and compensates for lining wear.

Lift and support the compressor. Make sure that all brakes are off (overrunbrake and hand brake lever). The brake cables must be free from tension. Lock the swivel cams of the wheel brake from the outside by means of a pin ∅ 4 mm (4) through the hole as shown in Fig. 5.5.

Turn the adjusting bolt (1) clockwise with a wrench till the wheel locks up. Center the brake shoes by actuating the parking brake several times.

Turn the adjusting bolt anti-clockwise until the wheel is running free in direction of travel (approx. 1 full turn of the adjusting bolt).

Check the position of the equalizer (Fig. 5.7, 6) with the parking brake actuated.

Perpendicular position of equalizer = identical clearance of wheel brakes.

Re-adjust the brake shoes, if necessary.

To test, slightly apply the parking brake and check identical brake torque on left and right side.

Remove locking pin (Fig. 5.5, 4). Remove clearance from brake cables.

Check all lock nuts (Fig. 5.7, 2).
5.6.2 TEST PROCEDURE OF BRAKE CABLE ADJUSTMENT

1. Check if the towing eye rod of the overrun brake mechanism is in the outmost position.
2. Check if the adjustable towbar (= option) is in the actual towing position.
3. Apply the hand brake lever.
4. Push the compressor a few centimeters backwards so that the brake lever is automatically pulled further up.
5. Check the position of the arrow marking "1" at the catch lock in combination with the arrow marking "2" at the toothed sector, according to Fig. 5.6 A,B,C,D.

![Diagram](image1)

A. Adjusted correctly

B. Acceptable

C. Too loose; adjust brake cables (Section 5.6.3)

D. Too tight; adjust brake cables (Section 5.6.3)

Fig. 5.6 Correct and wrong position of markings

5.6.3 BRAKE CABLE ADJUSTMENT

1. With the towing eye pulled out in the outmost position and the hand brake lever in the downward position (Fig. 5.8), loosen the lock nuts (Fig. 5.7, 2). Turn adjusting nuts and brake cable nuts (Fig. 5.7, 4) clockwise until there is no slack in the brake mechanism.

The equalizer (Fig. 5.7, 6) must remain perpendicular to main brake cable (Fig. 5.7, 5).

2. Apply the hand brake lever several times and repeat the adjustment. Tighten the nuts with their lock nuts (Fig. 5.7, 2). Remove the jack and the blocks.

3. Road test the compressor and brake several times. Check brake shoe and brake cable adjustment and if necessary adjust.

![Diagram](image2)

Fig. 5.8 Hand brake lever downward - brake not operated
6. PROBLEM SOLVING

It is assumed that the engine is in good condition and that there is adequate fuel flow to the filter and injection equipment.

An electrical fault must be traced by an electrician.

Make sure that the wires are not damaged and that they are clamped tight to their terminals.

For position of dip switches refer to section 2.8.1 Circuit Diagram.

### 6.1 ALTERNATOR PRECAUTIONS

1. Never reverse the polarity of the battery or the alternator.
2. Never break any alternator or battery connections while the engine is running.
3. When recharging the battery, disconnect it from the alternator. Before using booster cables to start the engine, be sure of the polarity and connect the batteries correctly.
4. Never operate the engine without the main or voltage sensing cables connected in the circuit.

b. Clean oil cooler. Refer to section 4.6.  
c. Check oil level. Top up with recommended oil. |
| 17. After working for some time, the unit stops for no apparent reason. | a. Air in fuel system, or insufficient fuel supply. | a. Check filters and hoses for leaks, dirt and bends. |
7. AVAILABLE OPTIONS

The XAS136 DdG can be delivered with following options:

Vessel type: 
- EURO
- ASME

Towbar: 
- Adjustable with brakes (A1)
- Fixed with brakes (A2)
- Fixed without brakes

Without towbar: 
- Support (without undercarriage)

Towing eyes: 
- Atlas Copco
- DIN
- Ball
- Italian
- GB
- NATO
- AC(France)

Towbar support: 
- Support leg
- Jockey wheel

Road signalisation: 
- Full (B)

Air quality equipment: 
- Aftercooler + water separator
- Aftercooler + water separator + fine filter PD
- Aftercooler + water separator + fine filter PD + QD
- Aftercooler + water separator + fine filter PD + reheater (C)
- Aftercooler + water separator + fine filter PD + QD + reheater (C)
- Aftercooler + water separator + reheater
- Lubricator on 7 bar units

Safety: 
- Wheel chocks
- Safety cartridge

Refinery equipment: 
- Spark arrestor
- Inlet shut down valve

Cold start: 
- -20 °C (-4 °F)

Customer colour: 
- Single
- Double
- Triple

A. These units meet your local safety regulations and are available with overrun and parking brakes.
B. Reflectors and lights for safety on the road.
C. Quality air through the aftercooler, reheater and fine filters.

1 l = 0.264 US gal
1 l = 0.220 Imp gal (UK)
1 l = 0.035 cu.ft
1 m = 3.281 ft
1 mm = 0.039 in
1 m³/min = 35.315 cfm
1 mbar = 0.401 in wc
1 N = 0.225 lbf
1 Nm = 0.738 lbf.ft

t °F = 32 + (1.8 x t °C)
t °C = (t °F - 32)/1.8
– A temperature difference of 1 °C = a temperature difference of 1.8 °F

9. DATA PLATE

1. Company code
2. Product code
3. Unit serial number
4. Name of manufacturer
5. EEC or national type approval number
6. Vehicle identification number
7. A Maximum permitted laden weight of the vehicle
   B Maximum permitted road weight of the vehicle
   C Maximum permitted laden weight of the towing eye
8. Model
9. Working pressure
10. Speed
11. Engine power
12. Manufacturing year
13. CE-mark in accordance with Machine Directive 89/392 EEC
14. Register number or number of notified body
Instruction Manual
for Portable Compressor
